

Take Control of Heat, Light and Privacy

EVB—External Venetian Blinds

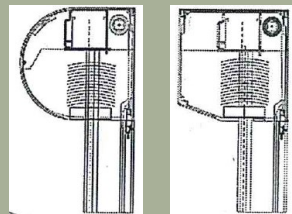

Don't build a greenhouse, build a Green House

Over 80% of the radiant heat from the sun stays inside the building envelope once it has passed through the glass. While this is great in winter, but when you want to stay cool in summer it either is very uncomfortable or the bills for air conditioning get expensive!

Sizes up to 4500mm wide and 4000mm high

Wind speed up to 100km/h

Integrated roll away flyscreens available on certain options.

Curtains are potentially costly but do little to solve the problem as the heat is already trapped inside. External venetians offer the ultimate solution, allowing tailored control of light, heat and views.

Either manually or automatically operated, allowing integration with building control systems where required.
